

Good Help — website

Files

- `index.html` — page structure
- `style.css` — all styling/colors/fonts
- `script.js` — scroll effect + admin panel logic
- `images/` — placeholder pictures (swap these with your real photos, keep the same filenames, or update the paths in the code)

How to replace images

Upload your real photos to the `images/` folder with these exact names, or rename the paths in

`index.html` :

- `bg-1.jpg` , `bg-2.jpg` — the two hero background photos that crossfade on scroll
- `portrait-1.jpg` — the passport-size photo in the About section
- `placeholder.jpg` — default photo used if a team member has no photo set

Admin panel

Tap the 3-bar icon (top right) → **Admin login** → password `Aa102030` .

From there you can edit:

- About us text
- Contact us text
- Social links (Facebook, WhatsApp, Email, Instagram)
- Add or remove people (name, role, short bio, photo path)

Important limit: edits are saved in the browser's local storage — meaning they only appear on the device/browser you made them on. If you need edits to show up for every visitor to the live site, that requires a small backend (like the Supabase setup you've used before) instead of local storage. Ask me if you want that upgrade.

Publishing to GitHub Pages

1. Create a repo, upload these files (keep the folder structure).
2. Repo Settings → Pages → set source to your main branch.

3. Your site will be live at

`https://yourusername.github.io/repo-name/` .
